TC1313

500 mA Synchronous Buck Regulator, + 300 mA LDO

Features

- Dual-Output Regulator (500 mA Buck Regulator and 300 mA Low-Dropout Regulator (LDO))
- Total Device Quiescent Current = 57 µA (Typical)
- Independent Shutdown for Buck and LDO Outputs
- Both Outputs Internally Compensated
- Synchronous Buck Regulator:
  - Over 90% Typical Efficiency
  - 2.0 MHz Fixed-Frequency PWM (Heavy Load)
  - Low Output Noise
  - Automatic PWM-to-PFM mode transition
  - Adjustable (0.8V to 4.5V) and Standard Fixed-Output Voltages (0.8V, 1.2V, 1.5V, 1.8V, 2.5V, 3.3V)
- Low-Dropout Regulator:
  - Low-Dropout Voltage = 137 mV Typical @ 200 mA
  - Standard Fixed-Output Voltages (1.5V, 1.8V, 2.5V, 3.3V)
- Small 10-pin 3x3 DFN or MSOP Package Options
- Operating Junction Temperature Range:
  - -40°C to +125°C
- Undervoltage Lockout (UVLO)
- Output Short Circuit Protection
- Overtemperature Protection

Applications

- Cellular Phones
- Portable Computers
- USB-Powered Devices
- Handheld Medical Instruments
- Organizers and PDAs

Description

The TC1313 device combines a 500 mA synchronous buck regulator and 300 mA Low-Dropout Regulator (LDO) to provide a highly integrated solution for devices that require multiple supply voltages. The unique combination of an integrated buck switching regulator and low-dropout linear regulator provides the lowest system cost for dual-output voltage applications that require one lower processor core voltage and one higher bias voltage.

The 500 mA synchronous buck regulator switches at a fixed frequency of 2.0 MHz when the load is heavy, providing a low-noise, small-size solution. When the load on the buck output is reduced to light levels, it changes operation to a Pulse Frequency Modulation (PFM) mode to minimize quiescent current draw from the battery. No intervention is necessary for smooth transition from one mode to another.

The LDO provides a 300 mA auxiliary output that requires a single 1 µF ceramic output capacitor, minimizing board area and cost. The typical dropout voltage for the LDO output is 137 mV for a 200 mA load.

The TC1313 device is available in either the 10-pin DFN or MSOP package.

Additional protection features include: UVLO, overtemperature and overcurrent protection on both outputs.

For a complete listing of TC1313 standard parts, consult your Microchip representative.

Package Type

10-Lead DFN *

$\overline{SHDN2}$	1	10 P_{GND}
V_{IN2}	2	9 L_X
V_{OUT2}	3 EP 11	8 V_{IN1}
NC	4	7 $\overline{SHDN1}$
A_{GND}	5	6 V_{FB1}/V_{OUT1}

10-Lead MSOP

$\overline{SHDN2}$	1	10 P_{GND}
V_{IN2}	2	9 L_X
V_{OUT2}	3	8 V_{IN1}
NC	4	7 $\overline{SHDN1}$
A_{GND}	5	6 V_{FB1}/V_{OUT1}

* Includes Exposed Thermal Pad (EP); see Table 3-1.

NOTES:

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

V_{IN} - A_{GND} 6.0V
All Other I/O ....(A_{GND} - 0.3V) to (V_{IN} + 0.3V)
L_X to P_{GND} ....-0.3V to (V_{IN} + 0.3V)
P_{GND} to A_{GND} .... -0.3V to +0.3V
Output Short Circuit Current ....Continuous
Power Dissipation (**Note 7**) ....Internally Limited
Storage temperature ....-65°C to +150°C
Ambient Temp. with Power Applied ....-40°C to +85°C
Operating Junction Temperature....................-40°C to +125°C
ESD protection on all pins (HBM) .... 3 kV

† Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Characteristics: V_{IN1} = V_{IN2} = $\overline{SHDN1,2}$ = 3.6V, C_{OUT1} = C_{IN} = 4.7 µF, C_{OUT2} = 1µF, L = 4.7 µH, V_{OUT1} (ADJ) = 1.8V, I_{OUT1} = 100 ma, I_{OUT2} = 0.1 mA T_A = +25°C. **Boldface** specifications apply over the T_A range of **-40°C to +85°C**.

Parameters	Sym	Min	Typ	Max	Units	Conditions

$\overline{SHDN1}$,$\overline{SHDN2}$, Input Leakage Current	I_{IN}	**-1.0**	±0.01	**1.0**	µA	V_{IN1} = V_{IN2} = 2.7V to 5.5V $\overline{SHDNX}$ = GND $\overline{SHDNY}$ = V_{IN}
Thermal Shutdown	T_{SHD}	—	165	—	°C	**Note 6**, **Note 7**
Thermal Shutdown Hysteresis	$T_{SHD-HYS}$	—	10	—	°C	
Undervoltage Lockout (V_{OUT1} and V_{OUT2})	UVLO	**2.4**	2.55	**2.7**	V	V_{IN1} Falling
Undervoltage Lockout Hysteresis	UVLO-$_{HYS}$	—	200	—	mV	

Note 1: The Minimum V_{IN} has to meet two conditions: $V_{IN} \geq 2.7V$ and $V_{IN} \geq V_{RX} + V_{DROPOUT}$, V_{RX} = V_{R1} or V_{R2}.

2: V_{RX} is the regulator output voltage setting.

3: $TCV_{OUT2} = ((V_{OUT2max} - V_{OUT2min}) * 10^6)/(V_{OUT2} * D_T)$.

4: Regulation is measured at a constant junction temperature using low duty cycle pulse testing. Load regulation is tested over a load range from 0.1 mA to the maximum specified output current.

5: Dropout voltage is defined as the input-to-output voltage differential at which the output voltage drops 2% below its nominal value measured at a 1V differential.

6: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature and the thermal resistance from junction to air. (i.e. T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation causes the device to initiate thermal shutdown.

7: The integrated MOSFET switches have an integral diode from the L_X pin to V_{IN}, and from L_X to P_{GND}. In cases where these diodes are forward-biased, the package power dissipation limits must be adhered to. Thermal protection is not able to limit the junction temperature for these cases.

8: V_{IN1} and V_{IN2} are supplied by the same input source.

NOTES:

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Pin	DFN	MSOP	Function
1	$\overline{\text{SHDN2}}$	$\overline{\text{SHDN2}}$	Active Low Shutdown Input for LDO Output Pin
2	V_{IN2}	V_{IN2}	Analog Input Supply Voltage Pin
3	V_{OUT2}	V_{OUT2}	LDO Output Voltage Pin
4	NC	NC	No Connect
5	A_{GND}	A_{GND}	Analog Ground Pin
6	V_{FB} / V_{OUT1}	V_{FB} / V_{OUT1}	Buck Feedback Voltage (Adjustable Version)/Buck Output Voltage (Fixed Version) Pin
7	$\overline{\text{SHDN1}}$	$\overline{\text{SHDN1}}$	Active Low Shutdown Input for Buck Regulator Output Pin
8	V_{IN1}	V_{IN1}	Buck Regulator Input Voltage Pin
9	L_X	L_X	Buck Inductor Output Pin
10	P_{GND}	P_{GND}	Power Ground Pin
11	EP	—	Exposed Pad. It is a thermal path to remove heat from the device. Electrically, this pad is at ground potential and should be connected to A_{GND}.

3.1 LDO Shutdown Input Pin ($\overline{\text{SHDN2}}$)

$\overline{\text{SHDN2}}$ is a logic-level input used to turn the LDO regulator on and off. A logic-high (> 45% of V_{IN}) will enable the regulator output. A logic-low (< 15% of V_{IN}) will ensure that the output is turned off.

3.2 LDO Input Voltage Pin (V_{IN2})

V_{IN2} is a LDO power-input supply pin. Connect variable-input voltage source to V_{IN2}. Connect V_{IN1} and V_{IN2} together with board traces as short as possible. V_{IN2} provides the input voltage for the LDO regulator. An additional capacitor can be added to lower the LDO regulator input ripple voltage.

3.3 LDO Output Voltage Pin (V_{OUT2})

V_{OUT2} is a regulated LDO output voltage pin. Connect a 1 µF or larger capacitor to V_{OUT2} and A_{GND} for proper operation.

3.4 No Connect Pin (NC)

No connection.

3.5 Analog Ground Pin (A_{GND})

A_{GND} is the analog ground connection. Tie A_{GND} to the analog portion of the ground plane (A_{GND}). See the physical layout information in **Section 5.0 "Application Circuits/Issues"** for grounding recommendations.

3.6 Buck Regulator Output Sense Pin (V_{FB}/V_{OUT1})

For V_{OUT1} adjustable-output voltage options, connect the center of the output voltage divider to the V_{FB} pin. For fixed-output voltage options, connect the output of the buck regulator to this pin (V_{OUT1}).

3.7 Buck Regulator Shutdown Input Pin ($\overline{\text{SHDN1}}$)

$\overline{\text{SHDN1}}$ is a logic-level input used to turn the buck regulator on and off. A logic-high (> 45% of V_{IN}) will enable the regulator output. A logic-low (< 15% of V_{IN}) will ensure that the output is turned off.

3.8 Buck Regulator Input Voltage Pin (V_{IN1})

V_{IN1} is the buck regulator power-input supply pin. Connect a variable-input voltage source to V_{IN1}. Connect V_{IN1} and V_{IN2} together with board traces as short as possible.

3.9 Buck Inductor Output Pin (L_X)

Connect L_X directly to the buck inductor. This pin carries large signal-level current; all connections should be made as short as possible.

3.10 Power Ground Pin (P_{GND})

Connect all large-signal level ground returns to P_{GND}. These large-signal level ground traces should have a small loop area and length to prevent coupling of switching noise to sensitive traces. Please see the physical layout information supplied in **Section 5.0 "Application Circuits/Issues"** for grounding recommendations.

3.11 Exposed Pad (EP)

For the DFN package, connect the EP to A_{GND} with vias into the A_{GND} plane.

TC1313

NOTES:

4.0 DETAILED DESCRIPTION

4.1 Device Overview

The TC1313 combines a 500 mA synchronous buck regulator with a 300 mA LDO. This unique combination provides a small, low-cost solution for applications that require two or more voltage rails. The buck regulator can deliver high-output current over a wide range of input-to-output voltage ratios while maintaining high efficiency. This is typically used for the lower-voltage, higher-current processor core. The LDO is a minimal parts-count solution (single-output capacitor), providing a regulated voltage for an auxiliary rail. The typical LDO dropout voltage (137 mV @ 200 mA) allows the use of very low input-to-output LDO differential voltages, minimizing the power loss internal to the LDO pass transistor. Integrated features include independent shutdown inputs, UVLO, overcurrent and overtemperature shutdown.

4.2 Synchronous Buck Regulator

The synchronous buck regulator is capable of supplying a 500 mA continuous output current over a wide range of input and output voltages. The output voltage range is from 0.8V (min) to 4.5V (max). The regulator operates in three different modes and automatically selects the most efficient mode of operation. During heavy load conditions, the TC1313 buck converter operates at a high, fixed frequency (2.0 MHz) using current mode control. This minimizes output ripple and noise (less than 8 mV peak-to-peak ripple) while maintaining high efficiency (typically > 90%). For standby or light-load applications, the buck regulator will automatically switch to a power-saving Pulse Frequency Modulation (PFM) mode. This minimizes the quiescent current draw on the battery while keeping the buck output voltage in regulation. The typical buck PFM mode current is 38 µA. The buck regulator is capable of operating at 100% duty cycle, minimizing the voltage drop from input to output for wide-input, battery-powered applications. For fixed-output voltage applications, the feedback divider and control loop compensation components are integrated, eliminating the need for external components. The buck regulator output is protected against overcurrent, short circuit and overtemperature. While shut down, the synchronous buck N-channel and P-channel switches are off, so the L_X pin is in a high-impedance state (this allows for connecting a source on the output of the buck regulator as long as its voltage does not exceed the input voltage).

4.2.1 FIXED-FREQUENCY PWM MODE

While operating in Pulse Width Modulation (PWM) mode, the TC1313 buck regulator switches at a fixed 2.0 MHz frequency. The PWM mode is suited for higher load current operation, maintaining low output noise and high conversion efficiency. PFM to PWM mode transition is initiated for any of the following conditions.

- Continuous inductor current is sensed
- Inductor peak current exceeds 100 mA
- The buck regulator output voltage has dropped out of regulation (step load has occurred)

The typical PFM-to-PWM threshold is 80 mA.

4.2.2 PFM MODE

PFM mode is entered when the output load on the buck regulator is very light. Once detected, the converter enters the PFM mode automatically and begins to skip pulses to minimize unnecessary quiescent current draw by reducing the number of switching cycles per second. The typical quiescent current for the switching regulator is less than 38 µA. The transition from PWM to PFM mode occurs when discontinuous inductor current is sensed, or the peak inductor current is less than 60 mA (typ.). The typical PWM to PFM mode threshold is 30 mA. For low input-to-output differential voltages, the PWM to PFM mode threshold can be low due to the lack of ripple current. It is recommended that V_{IN1} be one volt greater than V_{OUT1} for PWM to PFM transitions.

4.3 Low-Dropout Regulator (LDO)

The LDO output is a 300 mA low-dropout linear regulator that provides a regulated output voltage with a single 1 µF external capacitor. The output voltage is available in fixed options only, ranging from 1.5V to 3.3V. The LDO is stable using ceramic output capacitors that inherently provide lower output noise and reduce the size and cost of the regulator solution. The quiescent current consumed by the LDO output is typically less than 43.7 µA, with a typical dropout voltage of 137 mV at 200 mA. The LDO output is protected against overcurrent and overtemperature. While operating in Dropout mode, the LDO quiescent current will increase, minimizing the necessary voltage differential needed for the LDO output to maintain regulation. The LDO output is protected against overcurrent and overtemperature.

4.4 Soft Start

Both outputs of the TC1313 are controlled during startup. Less than 1% of V_{OUT1} or V_{OUT2} overshoot is observed during start-up from V_{IN} rising above the UVLO voltage; or SHDN1 or SHDN2 being enabled.

4.5 Overtemperature Protection

The TC1313 has an integrated overtemperature protection circuit that monitors the device junction temperature and shuts the device off if the junction temperature exceeds the typical 165°C threshold. If the overtemperature threshold is reached, the soft start is reset so that, once the junction temperature cools to approximately 155°C, the device will automatically restart.

5.0 APPLICATION CIRCUITS/ ISSUES

5.1 Typical Applications

The TC1313 500 mA buck regulator + 300 mA LDO operates over a wide input-voltage range (2.7V to 5.5V) and is ideal for single-cell Li-Ion battery-powered applications, USB-powered applications, three-cell NiMH or NiCd applications and 3V to 5V regulated input applications. The 10-pin MSOP and 3x3 DFN packages provide a small footprint with minimal external components.

5.2 Fixed-Output Application

A typical V_{OUT1} fixed-output voltage application is shown in "**Typical Application Circuits**". A 4.7 µF V_{IN1} ceramic input capacitor, 4.7 µF V_{OUT1} ceramic capacitor, 1.0 µF ceramic V_{OUT2} capacitor and 4.7 µH inductor make up the entire external component solution for this dual-output application. No external dividers or compensation components are necessary. For this application, the input-voltage range is 2.7V to 4.2V, V_{OUT1} = 1.5V at 500 mA, while V_{OUT2} = 2.5V at 300 mA.

5.3 Adjustable-Output Application

A typical V_{OUT1} adjustable-output application is also shown in "**Typical Application Circuits**". For this application, the buck regulator output voltage is adjustable by using two external resistors as a voltage divider. For adjustable-output voltages, it is recommended that the top resistor divider value be 200 kΩ. The bottom resistor divider can be calculated using the following formula:

EQUATION 5-1:

$$R_{BOT} = R_{TOP} \times \left(\frac{V_{FB}}{V_{OUT1} - V_{FB}} \right)$$

Example:

R_{TOP} = 200 kΩ
V_{OUT1} = 2.1V
V_{FB} = 0.8V
R_{BOT} = 200 kΩ x (0.8V/(2.1V – 0.8V))
R_{BOT} = 123 kΩ (Standard Value = 121 kΩ)

For adjustable output applications, an additional R-C compensation is necessary for the buck regulator control loop stability. Recommended values are:

R_{COMP} = 4.99 kΩ
C_{COMP} = 33 pF

An additional V_{IN2} capacitor can be added to reduce high-frequency noise on the LDO input-voltage pin (V_{IN2}). This additional capacitor (1 µF) is not necessary for typical applications.

5.4 Input and Output Capacitor Selection

As with all buck-derived dc-dc switching regulators, the input current is pulled from the source in pulses. This places a burden on the TC1313 input filter capacitor. In most applications, a minimum of 4.7 µF is recommended on V_{IN1} (buck regulator input-voltage pin). In applications that have high source impedance, or have long leads (10 inches) connecting to the input source, additional capacitance should be used. The capacitor type can be electrolytic (aluminum, tantalum, POSCAP, OSCON) or ceramic. For most portable electronic applications, ceramic capacitors are preferred due to their small size and low cost.

For applications that require very low noise on the LDO output, an additional capacitor (typically 1 µF) can be added to the V_{IN2} pin (LDO input voltage pin).

Low ESR electrolytic or ceramic can be used for the buck regulator output capacitor. Again, ceramic is recommended because of its physical attributes and cost. For most applications, a 4.7 µF is recommended. Refer to Table 5-1 for recommended values. Larger capacitors (up to 22 µF) can be used. There are some advantages in load step performance when using larger value capacitors. Ceramic materials, X7R and X5R, have low temperature coefficients and are well within the acceptable ESR range required.

TABLE 5-1: TC1313 RECOMMENDED CAPACITOR VALUES

	C (V_{IN1})	C (V_{IN2})	C_{OUT1}	C_{OUT2}
Min	4.7 µF	none	4.7 µF	1 µF
Max	none	none	22 µF	10 µF

5.5   Inductor Selection

For most applications, a 4.7 µH inductor is recommended to minimize noise. There are many different magnetic core materials and package options to select from. That decision is based on size, cost and acceptable radiated energy levels. Toroid and shielded ferrite pot cores will have low radiated energy but tend to be larger and more expensive. With a typical 2.0 MHz switching frequency, the inductor ripple current can be calculated based on the following formulas.

EQUATION 5-2:

$$DutyCycle = \frac{V_{OUT}}{V_{IN}}$$

Duty cycle represents the percentage of switch-on time.

EQUATION 5-3:

$$T_{ON} = DutyCycle \times \frac{1}{F_{SW}}$$

Where:

F_{SW} = Switching Frequency

The inductor ac ripple current can be calculated using the following relationship:

EQUATION 5-4:

$$V_L = L \times \frac{\Delta I_L}{\Delta t}$$

Where:

V_L = voltage across the inductor ($V_{IN} - V_{OUT}$)

Δt = on-time of P-channel MOSFET

Solving for ΔI_L = yields:

EQUATION 5-5:

$$\Delta I_L = \frac{V_L}{L} \times \Delta t$$

When considering inductor ratings, the maximum DC current rating of the inductor should be at least equal to the maximum buck regulator load current (I_{OUT1}), plus one half of the peak-to-peak inductor ripple current ($1/2 * \Delta I_L$). The inductor DC resistance can add to the buck converter I^2R losses. A rating of less than 200 mΩ is recommended. Overall efficiency will be improved by using lower DC resistance inductors.

TABLE 5-2:   TC1313 RECOMMENDED INDUCTOR VALUES

Part Number	Value (µH)	DCR Ω (max)	MAX I_{DC} (A)	Size WxLxH (mm)

5.6   Thermal Calculations

5.6.1   BUCK REGULATOR OUTPUT (V_{OUT1})

The TC1313 is available in two different 10-pin packages (MSOP and 3x3 DFN). By calculating the power dissipation and applying the package thermal resistance, (θ_{JA}), the junction temperature is estimated. The maximum continuous junction temperature rating for the TC1313 is +125°C.

To quickly estimate the internal power dissipation for the switching buck regulator, an empirical calculation using measured efficiency can be used. Given the measured efficiency (**Section 2.0 "Typical Performance Curves"**), the internal power dissipation is estimated below.

EQUATION 5-6:

$$\left(\frac{V_{OUT1} \times I_{OUT1}}{Efficiency}\right) - (V_{OUT1} \times I_{OUT1}) = P_{Dissipation}$$

The first term is equal to the input power (definition of efficiency, P_{OUT}/P_{IN} = Efficiency). The second term is equal to the delivered power. The difference is internal power dissipation. This estimate assumes that most of the power lost is internal to the TC1313. There is some percentage of power lost in the buck inductor, with very little loss in the input and output capacitors.

For example, for a 3.6V input, 1.8V output with a load of 400 mA, the efficiency taken from Figure 2-7 is approximately 84%. The internal power dissipation is approximately 137 mW.

5.6.2 LDO OUTPUT (V_{OUT2})

The internal power dissipation within the TC1313 LDO is a function of input voltage, output voltage and output current. The following equation can be used to calculate the internal power dissipation for the LDO.

EQUATION 5-7:

$$P_{LDO} = (V_{IN(MAX)} - V_{OUT2(MIN)}) \times I_{OUT2(MAX)}$$

Where:

P_{LDO} = LDO Pass device internal power dissipation

$V_{IN(MAX)}$ = Maximum input voltage

$V_{OUT(MIN)}$ = LDO minimum output voltage

The maximum power dissipation capability for a package can be calculated given the junction-to-ambient thermal resistance and the maximum ambient temperature for the application. The following equation can be used to determine the package's maximum internal power dissipation.

5.6.3 LDO POWER DISSIPATION EXAMPLE

Input Voltage

V_{IN} = 5V ±10%

LDO Output Voltage and Current

V_{OUT} = 3.3V

I_{OUT} = 300 mA

Internal Power Dissipation

$P_{LDO(MAX)}$ = $(V_{IN(MAX)} - V_{OUT2(MIN)})$ x $I_{OUT2(MAX)}$

P_{LDO} = (5.5V) – (0.975 x 3.3V)) x 300 mA

P_{LDO} = 684.8 mW

5.7 PCB Layout Information

Some basic design guidelines should be used when physically placing the TC1313 on a Printed Circuit Board (PCB). The TC1313 has two ground pins, identified as A_{GND} (analog ground) and P_{GND} (power ground). By separating grounds, it is possible to minimize the switching frequency noise on the LDO output. The first priority, while placing external components on the board, is the input capacitor (C_{IN1}). Wiring should be short and wide; the input current for the TC1313 can be as high as 800 mA. The next priority would be the buck regulator output capacitor (C_{OUT1}) and inductor (L_1). All three of these components are placed near their respective pins to

minimize trace length. The C_{IN1} and C_{OUT1} capacitor returns are connected closely together at the P_{GND} plane. The LDO optional input capacitor (C_{IN2}) and LDO output capacitor C_{OUT2} are returned to the A_{GND} plane. The analog ground plane and power ground plane are connected at one point (shown near L_1). All other signals (SHDN1, SHDN2, feedback in the adjustable output case) should be referenced to A_{GND} and have the A_{GND} plane underneath them.

FIGURE 5-1: *Component Placement, Fixed-Output 10-Pin MSOP.*

There will be some difference in layout for the 10-pin DFN package due to the thermal pad. A typical fixed-output DFN layout is shown below. For the DFN layout, the V_{IN1} to V_{IN2} connection is routed on the bottom of the board around the TC1313 thermal pad.

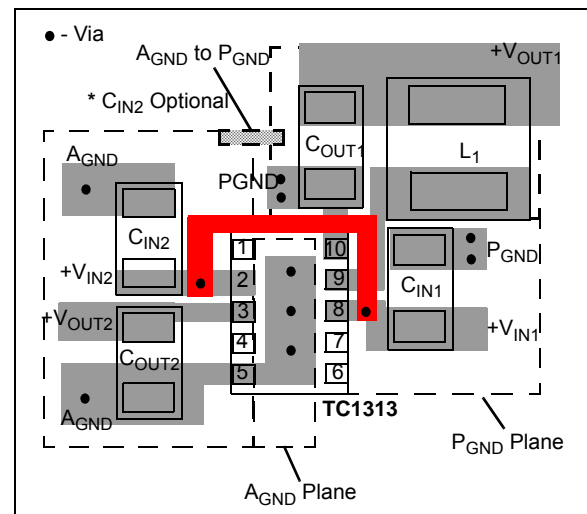

FIGURE 5-2: *Component Placement, Fixed-Output 10-Pin DFN.*

TC1313

5.8 Design Example

V_{OUT1} = 2.0V @ 500 mA
V_{OUT2} = 3.3V @ 300 mA
V_{IN} = 5V ±10%
L = 4.7 µH

Calculate PWM mode inductor ripple current

Nominal Duty
Cycle = 2.0V/5.0V = 40%

P-channel
Switch-on time = 0.40 x 1/(2 MHz) = 200 ns

V_L = $(V_{IN}-V_{OUT1})$ = 3V
ΔI_L = (V_L/L) x T_{ON} = 128 mA

Peak inductor current:

$I_{L(PK)}$ = $I_{OUT1}+1/2\Delta I_L$ = 564 mA

Switcher power loss:

Use efficiency estimate for 1.8V from Figure 2-7

Efficiency = 84%, P_{DISS1} = 190 mW

Resistor Divider:

R_{TOP} = 200 kΩ
R_{BOT} = 133 kΩ

LDO Output:

P_{DISS2} = $(V_{IN(MAX)} -$
$V_{OUT2(MIN)})$ x $I_{OUT2(MAX)}$
P_{DISS2} = (5.5V – (0.975) x 3.3V) x 300 mA
P_{DISS2} = 684.8 mW

Total
Dissipation = 190 mW + 685 mW = 875 mW

Junction Temp Rise and Maximum Ambient
Operating Temperature Calculations

10-Pin MSOP (4-Layer Board with internal Planes)

$R\theta_{JA}$ = 113° C/Watt

Junction Temp.
Rise = 875 mW x 113° C/Watt = 98.9°C

Max. Ambient
Temperature = 125°C - 98.9°C

Max. Ambient
Temperature = 26.1°C

10-Pin DFN

$R\theta_{JA}$ = 41° C/Watt (4-Layer Board with
internal planes and 2 vias)

Junction Temp.
Rise = 875 mW x 41° C/Watt = 35.9°C

Max. Ambient
Temperature = 125°C - 35.9°C

Max. Ambient
Temperature = 89.1°C

This is above the +85°C max. ambient temperature.

6.0 PACKAGING INFORMATION

6.1 Package Marking Information

10-Lead MSOP   Example:

```
XXXXXX
YWWNNN
  ○
```

```
51H0E
527256
  ○
```
— 5 = TC1313
— 1 = 1.375V V_{OUT1}
— H = 2.6V V_{OUT2}
— 0 = Default

10-Lead DFN   Example:

```
XXXX
YYWW
NNN
```

```
51H0
0527
256
```
Second letter represents V_{OUT1} configuration:

Code	V_{OUT1}	Code	V_{OUT1}	Code	V_{OUT1}
A	3.3V	J	2.4V	S	1.5V
B	3.2V	K	2.3V	T	1.4V
C	3.1V	L	2.2V	U	1.3V
D	3.0V	M	2.1V	V	1.2V
E	2.9V	N	2.0V	W	1.1V
F	2.8V	O	1.9V	X	1.0V
G	2.7V	P	1.8V	Y	0.9V
H	2.6V	Q	1.7V	Z	Adj
I	2.5V	R	1.6V	1	1.375V

Third letter represents V_{OUT2} configuration:

Code	V_{OUT2}	Code	V_{OUT2}	Code	V_{OUT2}
A	3.3V	J	2.4V	S	1.5V
B	3.2V	K	2.3V	T	—
C	3.1V	L	2.2V	U	—
D	3.0V	M	2.1V	V	—
E	2.9V	N	2.0V	W	—
F	2.8V	O	1.9V	X	—
G	2.7V	P	1.8V	Y	—
H	2.6V	Q	1.7V	Z	—
I	2.5V	R	1.6V		

Fourth letter represents +50 mV Increments:

Code		Code	
0	Default	2	+50 mV to V2
1	+50 mV to V1	3	+50 mV to V1 and V2

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.
